MyBud
Student Assistant

A Django application for five everyday student tasks

Bikash Kushwaha

Hosted portfolio edition | October 2026

Five tools in one student workspace

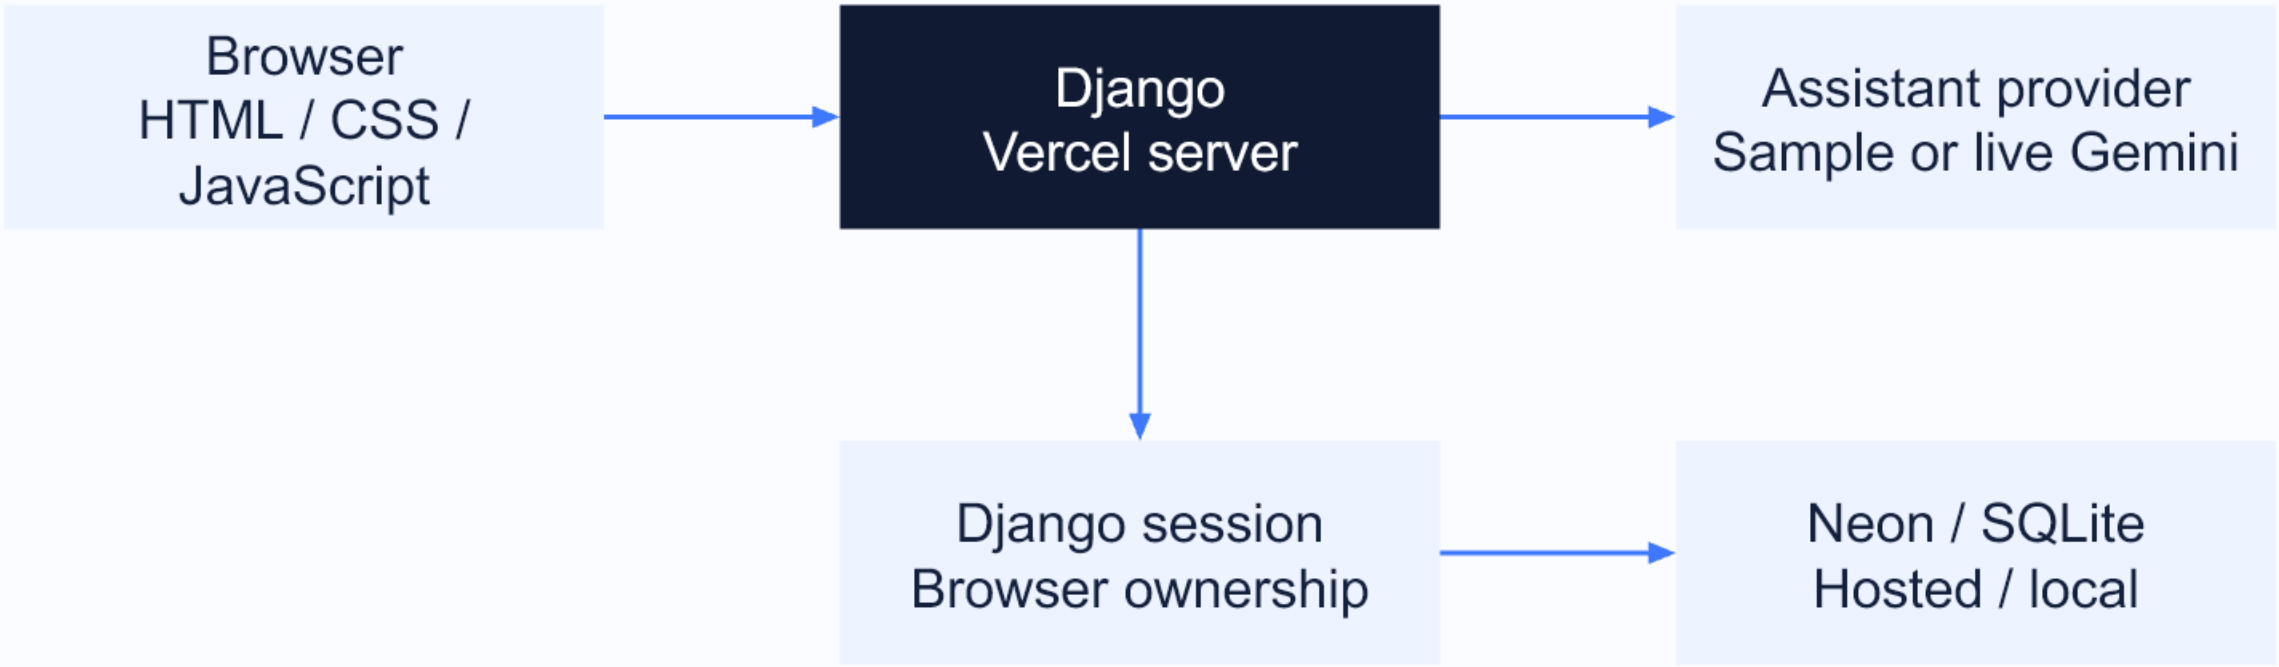

A consistent dark blue interface connects each task to a clear result.

Tool	Input	Result
Chat	A question or study prompt	Assistant response
Code review	A code snippet	Explanations and review suggestions
Recipes	Ingredients and optional image	Recipe ideas
Travel	Destination and trip duration	A day-by-day itinerary
Expenses	Category, amount and budget	Saved records and monthly totals

The four assistant tools share a provider. Expenses use persistent database storage.

Django coordinates the application

Browser forms and JSON requests reach one server-side application.

Hosted in Singapore with Neon PostgreSQL and TLS. Local development retains SQLite.

Sample mode and live AI are explicit

Default sample mode

Works without an API key.

Returns disclosed sample content.

Also checks Python syntax locally.

No model inference runs.

Optional live Gemini

Uses the google-genai client.

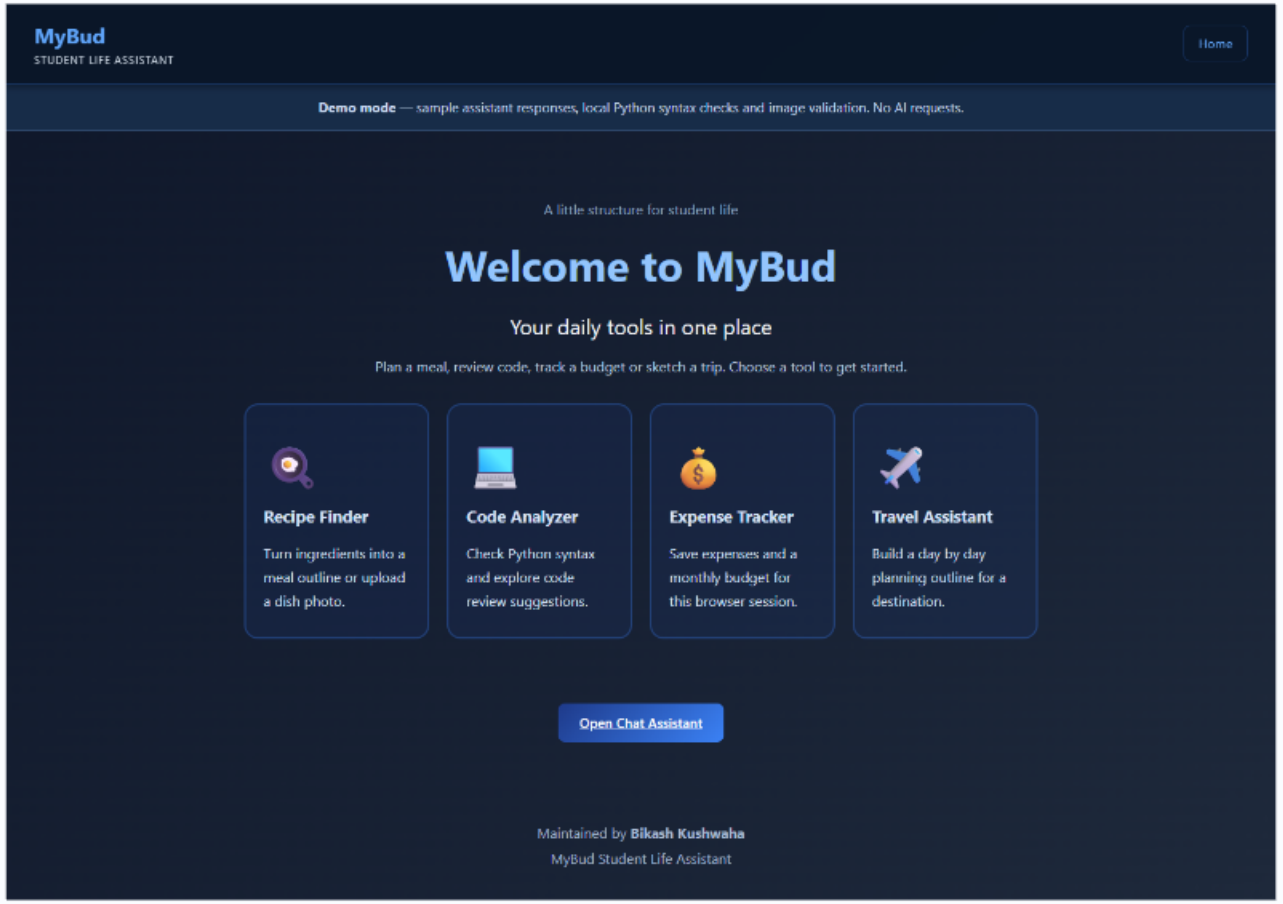

Requires a server-side API key.

The model is configurable.

Responses depend on the provider.

Assistant output needs review. A working sample does not establish live model quality.

The dashboard makes each tool discoverable

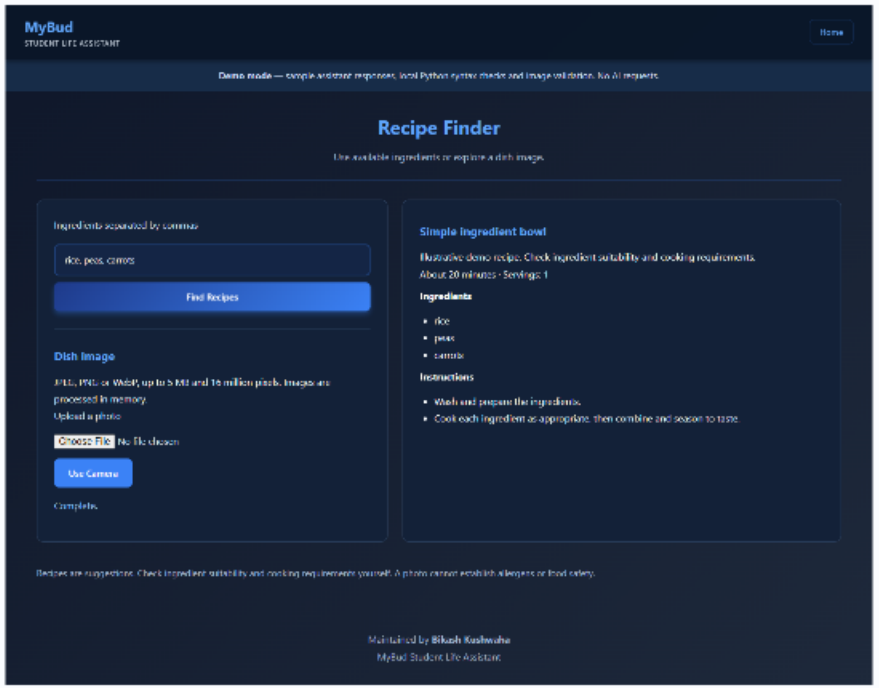

One entry point

Open a task, enter the relevant details, and review the result.

The preserved dark blue style keeps the tools visually consistent.

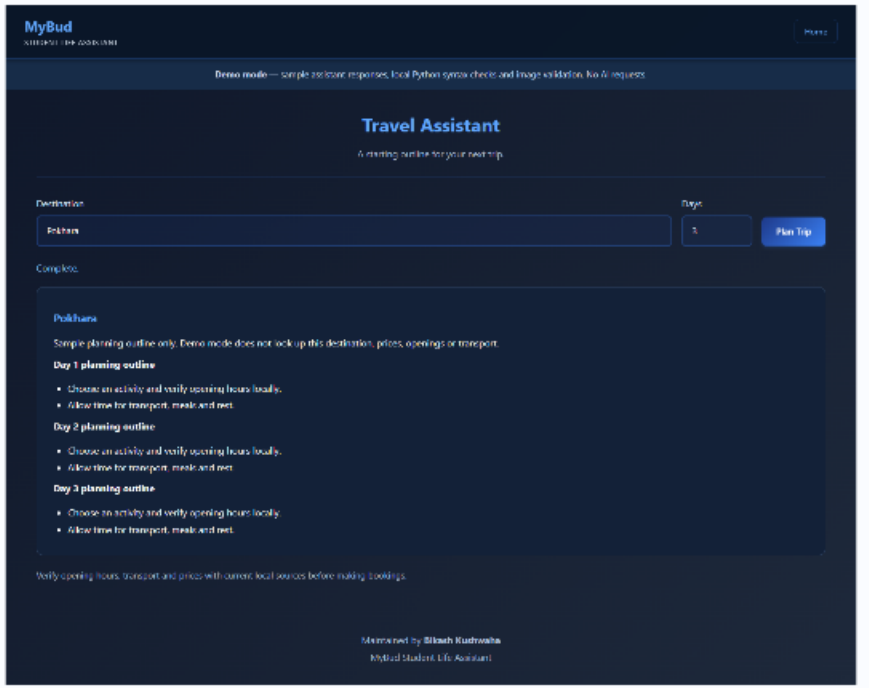

Recipes and travel show structured results

Recipe suggestions

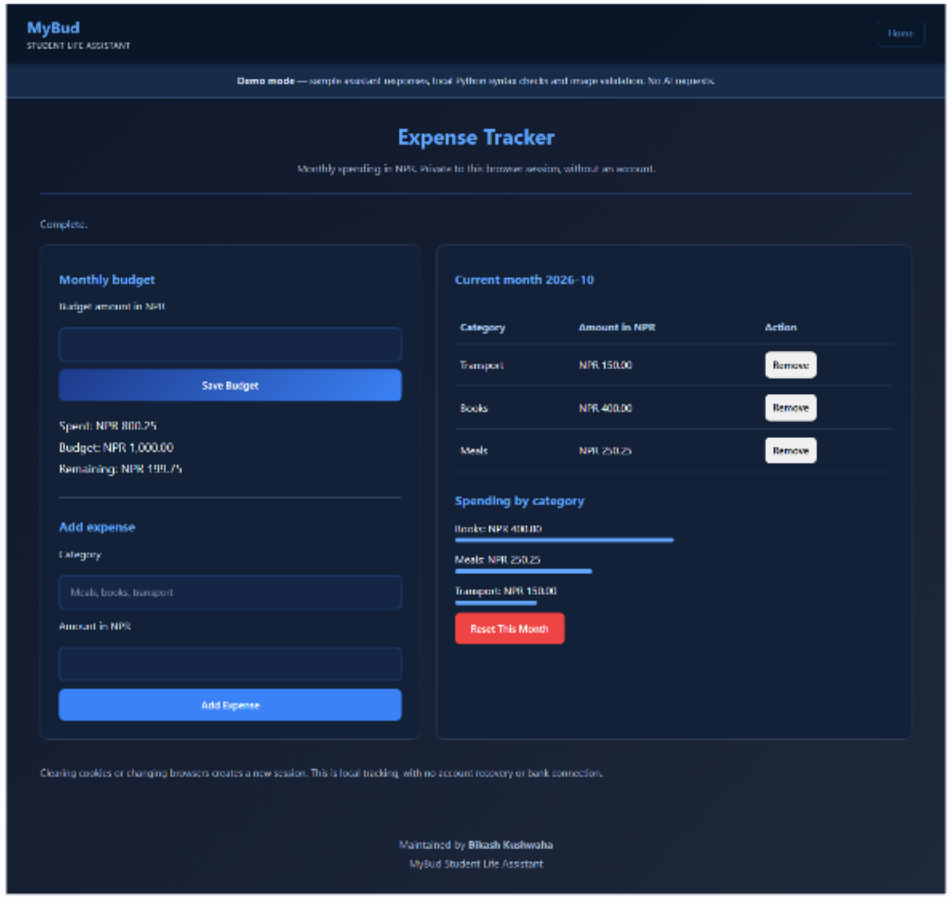

Ingredients and an optional image are validated before submission.

Travel itinerary

Destination and trip duration organize a readable day-by-day plan.

Expenses persist across page reloads

Captured NPR month summary

Measure	NPR
Budget	1,000.00
Spent	800.25
Remaining	199.75

Add and delete saved entries.
Set or reset the monthly budget.
Amounts use Decimal validation.

Ownership follows the current browser session. Account login and cross-device sync are outside scope.

Verification covers the deployed app

28 tests passed locally and in GitHub Actions

Area	Recorded evidence
Backend and CI	28 tests plus Ruff lint and format checks passed
Django checks	No system-check issues; no migration drift
Hosted storage	Neon PostgreSQL with TLS; migrations completed
Public browser QA	All tools, uploads, expenses and session isolation
Responsive checks	Six routes at desktop and mobile widths

No authenticated live-provider call was run. Live request contracts use mocked provider responses.

Run locally with an explicit configuration

Local setup

```
python -m venv .venv
.venv\Scripts\Activate.ps1
python -m pip install -r requirements-lock.txt
python manage.py migrate
python manage.py collectstatic --noinput
python manage.py runserver
```

Configuration

Vercel Django in Singapore.
Neon PostgreSQL storage.

MYBUD_MODE=demo.

Local: SQLite with .env settings.

Uploads: hosted 3 MB; local 5 MB.

Demo: https://mybud-student-assistant.vercel.app
Code: https://github.com/BikashCoder31/mybud-student-assistant

A clear scope supports future development

Current limits

Sample AI content is canned.

Live AI needs external credentials.

Session storage has no account sync.

Neon free-tier resource limits apply.

Next steps

Add account-based ownership.

Evaluate live responses with test prompts.

Add expense export and backup policy.

Add shared rate controls and monitoring.
